

# TRANSFORMING THE MODERN WORKPLACE

Robotic Process Automation (RPA) uses software to manage IT application and websites in the same way any human user would. By allowing businesses to automate tasks in this way, it is leading to a fundamental shift in the way they operate.

To discover what your peers think about the prospect of RPA, we surveyed 500 senior decision makers in businesses with between 50-999 employees.

## KEY BUSINESS BENEFITS OF RPA

### Reduced costs

When work is automated, not only can it be completed faster, it can also be performed round-the-clock, so you can increase your output for less.

### Employee empowerment

RPA allows your staff members to reduce the time they spend on monotonous tasks, and instead focus on more strategic work.

### Improved accuracy

Even the most careful human will unfortunately make a mistake. With RPA, the work is consistently performed error-free.

### Greater control

RPA offers the ability to gather, organise, track, analyse, report on and store valuable data, which can then be used to improve your current operations.

Is now the time for you to embrace the RPA revolution and see what your business can become?
